Introduction

- Auditory processing disorder (APD) may present as listening difficulties despite normal peripheral hearing
- The UCAST-FW (O'Beirne et al., 2012; Rickard et al., 2013) is an adaptive low-pass-filtered speech test used in APD assessment
- Original UCAST-FW stimuli (NU-CHIPS) are less suitable for NZ/Australian children
- To address this, the UC4AFC monosyllabic word list was developed using NZ/Australian English phonemic contrasts
- Initial 98-word list (created by Murray and O'Beirne; Murray, 2012) included:
 - target word
 - one semantic or unrelated foil
 - two phonemic foils
- Here we summarise three refinement and validation studies supporting paediatric clinical use

Study 1 – Recording words, selecting images (Anderson, 2024)

Objectives:

- Select representative images for each of the 98 target words
- Create audiovisual recordings for future AV-integration studies
- Evaluate low-pass-filter intelligibility characteristics of the recordings

Method:

- 392 candidate images collected (4 per target word)
- 43 adults selected “best image for children <12 years”
- Audiovisual recordings created for all target words
- 35 adults completed auditory-alone identification under 8–9 low-pass filter conditions (200–1500 Hz)
- Responses collected in:
 - open-set format
 - closed-set four-alternative forced choice (4AFC) format
- Data used to evaluate low-pass-filter psychometric characteristics for word list normalisation (*data not shown*)

Results:

- Strong image agreement was observed for several target words, including: chalk (98%), comb (95%), cap (86%), dirt (81%), leg (81%).
- Low-pass-filter results informed later item selection

Figure 1: Audiovisual recording process. Setup (top) and post-processed frame.

Figure 2 (left): Example vote distributions for candidate images corresponding to the target words *gate*, *pig*, *boat*, and *goat*.

Figure 3 (right): A finalised UC4AFC test plate for the target word *goat* with foils *boat*, *gate*, and *pig*.

Study 2 – Spontaneous naming by 4-year-olds (Chong, 2025)

Objectives:

- Evaluate whether four-year-olds consistently produced intended labels
- Quantify naming variability and naming latency

Method:

- 30 four-year-old children from low socioeconomic backgrounds participated
- Children viewed:
 - 98 selected UC4AFC images, 17 alternative candidate images
- Images presented with prompting phrases (“This is...”, “These are...”, etc.)
- Naming latency measured using synchronised audiovisual recordings
- Analyses included:
 - intended name agreement (the response matched our intended name)
 - target word inclusion (the target word was included within a longer response)
 - naming diversity using entropy statistic H (Snodgrass & Vanderwart, 1980) expressed as a percentage of the theoretical maximum for the sample size

Results:

Naming diversity ranged from near 0% (high agreement/low variability) to ~90% of theoretical maximum entropy (low agreement/high variability).

Study 3 – Receptive identification by 4-year-olds (Riley, 2026)

Objective: Determine whether four-year-olds could accurately and rapidly identify intended targets in 4AFC format

Method:

- 45 four-year-old children completed receptive 4AFC task
- Accuracy and response latency recorded for all 98 target items

Results:

- Approximately three quarters of items demonstrated:
 - >75% identification accuracy
 - median latency <3.5 s
- These items identified as strong candidates for final inclusion
- Poorer-performing items considered for exclusion

Figure 6: Median receptive identification latency versus proportion correctly identified for each target item.

Final list composition

Final inclusion decisions incorporated:

- low-pass filter normalisation results
- expressive naming results
- receptive identification results
- phonemic foil balance requirements

Item #	Target	Foil 1	Foil 2	Foil 3	Target and 1	Target and 2	Target and 3

Table 1: The two finalised UC4AFC word lists, and the categories of each foil.

Category	Set 1	Set 2	Total
Initial C only	15	15	30
Initial C, V	4	4	8
V only	18	18	36
Final C only	5	6	11
V, final C	14	14	28
Initial C, final C	10	9	19
Semantic	15	16	31
Unrelated	18	17	35
Initial C total	29	28	57
V total	36	36	72
Final C total	29	29	58

Vowel	Set 1	Set 2	Total Targets	Targets %
TRAP	4	5	9	15.8%
FLEECE	4	3	7	10.6%
HIT	3	4	7	10.6%
LOT	3	3	6	9.1%
SIBUT	3	3	6	9.1%
GOAT	3	3	6	9.1%
PRICE	2	3	5	7.6%
NURSE	2	2	4	6.1%
THOUGHT	2	1	3	4.5%
START	2	1	3	4.5%
DRESS	2	1	3	4.5%
MOUTH	1	1	2	3.0%
FOOT	1	1	2	3.0%
FACE	1	1	2	3.0%
GOOSE	0	1	1	1.5%
Total	33	33	66	100%

Tables 2 and 3: Occurrences of foil categories (above) and target vowels (right) in the two finalised word lists.

- No included target words fell below 75% correct on receptive testing
- Only *chin* and *ship* exceeded 3.5 s median receptive latency
- Poor spontaneous naming did not necessarily predict poor receptive identification
 - Ten included items had <25% expressive target-word inclusion but still achieved 85% ± 5% receptive accuracy
 - Expressive and receptive latencies showed weak but significant correlation ($r = .35$, $p < .01$)

Conclusion

- The UC4AFC provides robust four-alternative monosyllabic stimuli that are more suitable for New Zealand and Australian children than previous North American materials.
- These findings support its use in paediatric speech discrimination assessment and future APD evaluation.
